

MEMECOIN TRADING FROM A TO Z

A practical guide to getting started, managing risk, reading market data and taking profits with discipline.

TRADE WITH TOMMYSBANK ON FOMO

10% off trading fees through the referral link

Potential access to Fomo giveaways worth up to \$300 in crypto, subject to availability and the terms shown on the platform.

fomo.family/r/biska

Before you begin

This page is more important than any strategy.

Memecoins can lose 100% of their value

They are highly speculative assets. A token can rise quickly, but it can also collapse within minutes, become impossible to sell, or be abandoned by its team. Only use capital you can afford to lose completely.

Educational content, not financial advice

TOMMYSBANK shares an operating process and educational material. No signal, data point, chart, or example guarantees any result. Every purchase and sale remains your own decision and responsibility.

Never use borrowed money

Do not use loans, revolving credit, or money reserved for rent, taxes, family expenses, or emergencies. Never chase losses by increasing your position size.

NON-NEGOTIABLE RULES

- Protect your capital before looking for profit.
- Always verify the contract address. Names and tickers can be copied.
- Take profits when the market offers them. Do not always wait for another 10x.
- Treat every position as if it could potentially go to zero.
- Never share seed phrases, private keys, 2FA codes, or sensitive screenshots.
- Keep records of trades and tax obligations according to your country of residence.

Referral link disclosure

By registering through fomo.family/r/biska, you may receive the stated promotional benefits, including the 10% fee discount communicated by TOMMYSBANK. The link may generate commissions or other benefits for TOMMYSBANK. Giveaways, prizes, and conditions may change and must be verified directly on Fomo.

A realistic objective

You do not need to predict every coin correctly. You need to avoid fatal mistakes, limit losses, recover capital when possible, and let a few winning trades offset many small or losing trades.

01

TOMMYSBANK PLAYBOOK

THE WORLD OF MEMECOINS

What you are really buying and why the price can move so quickly.

WWW.TOMMYSIGNALS.COM

What is a memecoin?

A token driven mainly by attention, narrative, and community.

A memecoin is a token whose value depends largely on its ability to attract attention. It may be inspired by a meme, a character, a news story, a community, or a cultural trend. Unlike many traditional projects, it often has no established product to justify its price.

ATTENTION

main fuel

LIQUIDITY

ability to enter and exit

RISK

possible total loss

Why some memecoins achieve 10x or 100x

- Small initial supply and low market cap. Relatively limited capital flows can move the price.
- Strong narrative. A new, simple, shareable theme attracts new buyers.
- Social distribution. X, Telegram, TikTok, and communities can amplify momentum.
- Low liquidity. It accelerates price increases, but makes crashes equally violent.
- Herd behavior. People buy because they see others buying, often without doing research.

Why most memecoins fail

- The meme loses attention and no new buyers arrive.
- Early holders sell into late buyers.
- Liquidity is insufficient or removed.
- The token is a copy, a honeypot, or contains dangerous functions.
- The community consists mainly of bots and artificial volume.
- The trader fails to take profits and turns a large gain into a loss.

TOMMYSBANK principle

Do not fall in love with the token. A memecoin is first and foremost a trade. The community may be great and the meme may be entertaining, but your objective remains managing capital and risk.

Blockchain, tokens, and wallets

The technical basics you need to know before pressing BUY.

Blockchain

A shared digital ledger that records transactions and token ownership. Solana, Base, and BNB Chain are examples of blockchains.

Token

An asset created through a smart contract or onchain program. Every token has a unique identifier called a contract address or mint address.

Wallet

A tool that controls addresses and authorizes transactions. A non-custodial wallet gives you control of the keys, but also full responsibility.

Stablecoin

A token designed to maintain a value close to a currency, such as USDC. It is often used as an operating balance.

Contract address: the most important detail

A token name is not unique. Dozens of coins may have the same name and ticker. The contract address, also called the CA or mint address on Solana, identifies the exact token. Always copy it from the correct source, which in this workflow is the TOMMYSBANK signal page.

Example

Ticker: \$PEPE can be copied. Name: PEPE can be copied. Logo: it can be copied. Contract address: this is the identifier you must compare character by character.

Custodial and non-custodial

TYPE	WHO CONTROLS IT	ADVANTAGE	RISK
Custodial	The platform manages the keys	Simpler experience	Dependence on the platform
Non-custodial	The user controls the keys	Greater control	Mistakes and lost credentials are the user's responsibility

Security rule

No legitimate support team will ask for your seed phrase or private key. Never enter them on websites received through DMs. Do not sign transactions you do not understand.

02

TOMMYSBANK PLAYBOOK

SETUP AND EXECUTION

How to connect the TOMMYSBANK workflow to the Fomo platform without skipping steps.

WWW.TOMMYSIGNALS.COM

Setting up Fomo and TOMMYSBANK

Account, deposit, notifications, and referral link access.

1. Register on Fomo with the TOMMYSBANK link

Referral link

<https://fomo.family/r/biska>

Stated benefit: 10% off trading fees. The account may also be eligible for giveaways managed directly by Fomo with prizes of up to \$300 in crypto, when available.

SCAN TO OPEN FOMO

2. Create and secure your account

- Use email or Apple ID, depending on the available options.
- Enable two-factor authentication when available.
- Use a unique password that you do not reuse on other services.
- Always check the domain before logging in.
- Do not leave your device unlocked and never share access codes.

3. Deposit only your operating balance

Fomo lists deposit options through crypto and, where available, card or Apple Pay. For crypto deposits, verify the supported network and asset before sending. Send a small test transaction first when the amount is significant.

Operating balance

This is the capital allocated to memecoin trading, not all your savings and not your entire crypto portfolio. Position-size percentages are calculated from this balance.

4. Enable TOMMYSBANK notifications

Open the TOMMYSBANK app, allow push notifications, and make sure they are not muted in your phone settings. Signals can lose relevance quickly, but speed does not mean buying without checks.

From signal to purchase

The complete operating workflow, with no shortcuts.

01	RECEIVE THE NOTIFICATION Open the TOMMYSBANK signal page and read any notes.
02	COPY THE CA Copy the token's full address, not just its name or ticker.
03	OPEN FOMO Go to the Search section and paste the CA into the search bar.
04	COMPARE Verify that the address, chain, name, and data match.
05	CHECK THE RISK Review liquidity, market cap, holders, volume, and alerts.
06	CALCULATE THE SIZE Use the balance percentage selected before the trade.
07	REVIEW THE PRICE Check price impact, fees, and the amount received.
08	BUY AND RECORD Confirm, then record the entry, size, and exit plan.

Do not buy just because a notification arrived

A signal is a starting point, not an automatic order. If the price has already risen significantly, liquidity is too low, or price impact is excessive, skipping the trade is a valid decision.

Checklist before confirming

- The contract address is identical to the one shown on TOMMYSBANK.
- The selected blockchain is correct.
- Liquidity allows you to enter and, more importantly, exit.
- There are no serious alerts involving sales, authorities, or distribution.
- Your position size respects the limit you set.
- You have already decided when to take profits and when to close at a loss.

03

TOMMYSBANK PLAYBOOK

RISK MANAGEMENT

The part that determines whether you stay in the market long enough to improve.

WWW.TOMMYSIGNALS.COM

Position sizing

How much to buy in each trade.

Position size is the amount allocated to a single trade. In memecoins it matters more than prediction: even a good idea can fail. An oversized position turns a normal mistake into damage that is difficult to recover from.

TOMMYSBANK method

PROFILE	SIZE OF BALANCE	USE
Cautious beginner	2% to 5%	Learning phase, very new coins, or limited liquidity
TOMMYSBANK standard	5%	Reference setting for most trades
Aggressive	10% maximum	Only when you understand the risk and accept the possibility of a total loss

10% is an aggressive position size

Five consecutive trades lost at 10% drastically reduce the balance. For a beginner, starting with 2% or 5% makes it easier to learn without putting the capital at serious risk.

Formula

SIZE = OPERATING BALANCE × PERCENTAGE

Example: \$1,000 balance × 5% = \$50 per trade. \$300 balance × 5% = \$15.

Portfolio rules

- Do not open too many positions correlated with the same trend.
- Keep part of the balance available for new opportunities and fees.
- Do not increase position size after a loss to recover quickly.
- Do not average down on a memecoin simply because its price has fallen.
- Reduce your size when you are tired, emotional, or unable to monitor the trade.
- If a loss prevents you from sleeping, your position size is too large.

Drawdown: why capital protection matters

BALANCE LOSS	GAIN REQUIRED TO BREAK EVEN
10%	11.1%
25%	33.3%
50%	100%
75%	300%

TOMMYSBANK selling strategy

Recover capital, lock in profits, and keep a moonbag.

Your exit plan must exist before the purchase. When price rises, euphoria and greed make selling more difficult. The following strategy uses percentages of the initial position, making the process clear.

2X

sell 50% of the initial position

5X

sell another 25% of the initial position

25%

leave it as a moonbag

Step 1: at 2x, sell 50%

If the price doubles and you sell half of the tokens, you will generally recover the initial investment, after fees, slippage, and execution differences. The remaining 50% can continue without keeping all the original capital exposed.

Step 2: at 5x, sell another 25%

When the token reaches five times the entry price, sell 25% of the initial token amount. At this point, you have realized additional profit and 25% of the initial tokens remain.

Step 3: manage the moonbag

The remaining portion can be sold gradually, closed when clear weakness appears, or kept for an exceptional move. A moonbag does not mean ignoring risk: liquidity, narrative, and distribution can deteriorate quickly.

Do not be greedy

Taking profits does not mean being afraid. It means turning a number on a screen into a real result. Nobody always sells at the top, and people who wait for the exact top often sell much lower.

Permitted adjustments

- If the token rises too quickly, you may sell a small portion even before 2x.
- If alerts, insider sales, or loss of liquidity appear, safety comes before the target.
- If the token no longer shows momentum, you are not required to hold until 2x.
- The percentages are a framework, not a guarantee, and they do not replace judgment.

Complete numerical example

How the plan works with a \$500 balance.

Assumption: \$500 operating balance, 5% position size, and a \$25 purchase. For simplicity, fees and slippage are excluded, although they reduce the result in real trading.

STAGE	TOKEN VALUE	ACTION	CASH RECEIVED	TOKENS REMAINING
Entry	1x	Buy	0 USD	100%
Target 1	2x	Sell 50% of initial position	25 USD	50%
Target 2	5x	Sell 25% of initial position	\$31.25	25%
Moonbag at 5x	5x	Hold or manage	0 USD	Value: \$31.25

25 USD

initial capital

\$56.25

cash received

\$31.25

moonbag a 5x

Conservative scenario

If the moonbag goes to zero after the two sales, you still received \$56.25 from a \$25 investment. The realized profit is \$31.25 before fees and slippage.

Favorable scenario

If the moonbag continues to rise, you remain exposed with 25% of the initial tokens while the capital and part of the profit have already been secured.

Common mistake

Selling 50% of the dollar value is not always equivalent to selling 50% of the initial tokens, especially after partial sales. To follow this method, think in terms of the number of tokens purchased at the start, or carefully use the percentage buttons on the remaining balance.

Practical conversion

After selling the initial 50%, to sell another 25% of the original position you must sell 50% of the tokens that remain. This leaves 25% of the initial token amount.

04

TOMMYSBANK PLAYBOOK

RISKS AND ONCHAIN DATA

Recognize the dangers before becoming someone else's exit liquidity.

WWW.TOMMYSIGNALS.COM

Rug pulls, honeypots, and scams

The main ways a memecoin can trap or destroy your capital.

RISK	WHAT IT MEANS	WARNING SIGN
Rug pull	The team or major holders extract value and abandon the token.	Removable liquidity, concentrated wallets, an anonymous team, and sudden selling.
Honeypot	You can buy but cannot sell, or selling is heavily restricted.	Sell-restriction alerts, failed sell tests, or an unverified contract.
Fake contract	A copied token with the same name, ticker, and logo.	A CA that differs from the official one or the TOMMYSBANK signal.
Pump and dump	Coordinated promotion followed by insider selling.	Sudden volume, aggressive influencers, and top holders dumping.
Fake volume	Artificial transactions simulate interest.	Many repetitive trades, few real holders, and volume inconsistent with liquidity.
Wallet drain	A malicious signature or website removes assets from the wallet.	Links received in DMs, seed phrase requests, and unclear signatures.

Minimum safety procedure

- Verify the CA from the TOMMYSBANK signal page and compare it on Fomo.
- Read every alert displayed by the platform.
- Check liquidity and the distribution of major holders.
- When possible, make a very small purchase and a test sale.
- Do not connect your wallet to random websites for claims, airdrops, or presales.
- Do not confuse a large follower count with trustworthiness.
- If anything is unclear, do not buy.

The most common scam relies on urgency

A scammer wants you to act before checking. Phrases such as “last chance,” “guaranteed 100x,” or “send now” should increase your caution, not your position size.

Reading the key data

Market cap, liquidity, volume, and distribution.

The price of a single coin tells you very little. A token priced at \$0.000001 can be more “expensive” than a token priced at \$1. To compare different tokens, you must examine market cap, supply, liquidity, volume, and holders.

Market cap

Price × circulating supply.
Represents the estimated total value of tokens in circulation. A low market cap means greater movement potential, but also greater fragility.

FDV

Price × maximum or total supply.
Helps estimate the theoretical value if the entire supply were circulating. A large gap may indicate dilution risk.

Liquidity

Measures how easily you can buy or sell without moving the price too much. Low liquidity makes exiting more difficult and increases slippage.

Volume

The value traded over a period. High volume may indicate interest, but it should be consistent with holders, liquidity, and real transactions.

Holder

The number of wallets that hold the token. This does not automatically equal real users, because one person can control multiple wallets.

Top holder

The percentage held by the largest wallets. Excessive concentration increases the risk of sales capable of crashing the price.

Market cap example

1,000,000,000 tokens × \$0.001 = \$1,000,000 market cap

To reach 2x with an unchanged supply, the market cap must rise to approximately \$2,000,000. To reach 10x, approximately \$10,000,000. In practice, supply, liquidity, and trading activity can make the path irregular.

Liquidity, slippage, and price impact

Three different concepts that determine your real execution price.

Liquidity is the depth available for trading. Slippage is the difference between the expected price and the price obtained. Price impact is the effect of your specific trade on the pool price.

CONCEPT	QUESTION TO ASK	ESEMPIO
Liquidity	Is there enough capital in the pool for me to exit?	With \$20,000 of liquidity, a \$5,000 sale can have a major impact.
Slippage	How much can the price worsen during execution?	You expect 100 tokens but receive 94 because of movement and tolerance.
Price impact	How much does my position size move the market?	A large position relative to the pool pushes the price up when buying and down when selling.
Fee	How much do I pay for the service, swap, and network?	It reduces net profit and can significantly affect small positions.

Liquidity-to-market-cap relationship

There is no universal threshold, but liquidity that is very small relative to market cap is a sign of fragility. An apparently high market cap does not guarantee that you can sell your position at that valuation. The value shown on the chart is theoretical until sufficient exit liquidity exists.

Simple example

A token has a \$1,000,000 market cap and \$25,000 of liquidity. The market cap looks significant, but a few large sales can exhaust the available side of the pool and cause a rapid crash.

How to reduce the problem

- Keep your position small relative to liquidity.
- Check price impact before confirming.
- Sell in multiple tranches when the position is large.
- Avoid setting extreme slippage without understanding its effect.
- Do not wait until everyone is selling at the same time.

Token distribution and authorities

Technical data that can change the risk profile.

On Solana, a mint may retain specific authorities. The mint authority may allow new tokens to be created and the supply to be increased. The freeze authority may allow token accounts to be frozen. Revoking these authorities reduces certain risks, but does not automatically make the project safe.

CHECK	WHY IT MATTERS	QUESTION
Mint authority	New units can dilute holders if the authority remains active.	Has it been revoked, or is there a transparent reason for it?
Freeze authority	It may prevent transfers from specific token accounts.	Has it been revoked? Does the platform show alerts?
Top 10 holders	Concentrated wallets can dominate the price.	How much do they hold, excluding pools and technical wallets?
Connected wallets	Multiple wallets may belong to the same insider.	Are there coordinated purchases or a common funding source?
Locked or burned liquidity	It reduces the risk of sudden removal, but does not eliminate other scams.	For how long, and what proof is available?

Distribution red flags

- A single non-technical wallet owns an enormous share.
- The top holders were funded by the same wallet shortly before launch.
- The declared supply does not match the onchain data.
- Many holders have nearly identical amounts and coordinated movements.
- Insiders begin selling while the community is encouraged to buy.

No single check is enough

A token can have revoked authorities and still be a pump and dump. It can have locked liquidity and terrible distribution. Evaluate the complete set of data.

05

TOMMYSBANK PLAYBOOK

CHARTS AND PSYCHOLOGY

Understand price movement without turning every candle into a certain prediction.

WWW.TOMMYSIGNALS.COM

Reading a chart as a beginner

Price, candles, trends, and essential levels.

A chart shows what has already happened, not what must happen next. In memecoins, news, wallets, and liquidity can quickly invalidate any pattern. Use the chart to place the trade in context, not to seek certainty.

Green candle

The price closed above its opening level during the selected period. This does not automatically mean it will continue rising.

Red candle

The price closed below its opening level. A red candle may represent normal profit-taking or the beginning of a crash.

Support

An area where buyers entered in the past. It is a zone, not a guaranteed line.

Resistance

An area where selling appeared. If broken with volume, it may become support.

Situations to avoid

- Buying a vertical candle. The more extended the move, the greater the risk of entering near a local top.
- Confusing a bounce with a reversal. After a crash, there may be a small recovery before further selling.
- Ignoring volume. A breakout without participation can fail quickly.
- Using timeframes that are too small. Every movement appears enormous and increases anxiety.
- Constantly moving the plan. A strategy is useless if it changes with every candle.

Healthy momentum and fragile momentum

HEALTHIER	MORE FRAGILE
Step-by-step growth with pauses and consolidation	Vertical candles with no pauses
Distributed volume and new holders	Volume concentrated in a few wallets
Pullbacks absorbed with stable liquidity	Every sale causes a deep drop
Narrative still expanding	Hype already everywhere and late buyers

Psychology: FOMO, greed, and revenge

The market exploits the emotions of traders without a plan.

FOMO

Fear of missing the opportunity. It makes you buy after a huge rise because “it is taking off.” Antidote: accept that there will always be another trade.

Greed

Refusing to sell because every target feels too low. Antidote: scheduled sales and the reminder that unrealized profit can disappear.

Revenge trading

Increasing frequency or size to recover a loss. Antidote: a mandatory break and a maximum daily limit.

Confirmation bias

You only seek information that supports the coin you bought. Antidote: actively look for reasons why the trade could fail.

Anti-emotion protocol

- Define position size and the selling plan before buying.
- After two consecutive impulsive mistakes, stop the session.
- Do not check PnL every second if it changes your behavior.
- Do not raise the target merely because the price is approaching it.
- Reward correct execution, not only profit.
- A coin you skipped is not money lost.

Guiding principle

“My job is not to capture the entire move. My job is to execute the plan well.”

Consistency comes from repeatable decisions, not from a single lucky trade.

06

TOMMYSBANK PLAYBOOK

PROCESS AND DISCIPLINE

Turn signals and data into a repeatable routine.

WWW.TOMMYSIGNALS.COM

TOMMYSBANK trading routine

What to do before, during, and after every session.

Before the session

- Check your operating balance and daily loss limit.
- Check TOMMYSBANK app notifications and your device connection.
- Choose the standard position size, for example 5%, before viewing signals.
- Avoid trading when tired, impaired, or distracted.
- Keep the journal open to record trades immediately.

During the trade

- Copy and verify the contract address.
- Check essential data and alerts.
- Confirm only when price impact and position size are acceptable.
- Set personal alerts at important levels.
- Execute partial sales without waiting for perfection.

After the trade

- Record realized PnL, fees, and the reason for exiting.
- Save a screenshot of the entry and exit.
- Rate the quality of execution from 1 to 5.
- Write down one mistake and one thing you did well.
- Do not immediately reopen the trade just because the token continues rising.

Useful limits

LIMIT	ESEMPIO	PURPOSE
Daily loss	3 standard position losses	Prevent emotional escalation
Number of trades	Maximum 5 trades	Reduce overtrading
Maximum position size	10% of the balance	Avoid extreme concentration
Break duration	30 minutes after an impulsive mistake	Regain clarity

The most common beginner mistakes

Recognizing them early costs less than learning them through your balance.

01 ALL IN

Putting the entire balance into one coin because it appears safe.

03 ENTRY AFTER THE PUMP

Buying while early participants are already selling.

05 BLIND AVERAGING DOWN

Adding capital to a token that is dying.

07 OVERTRADING

Paying fees and taking mediocre trades out of boredom.

09 NO JOURNAL

Repeating the same mistakes without noticing.

02 UNVERIFIED CA

Buying a copy with the same name and logo.

04 NO PROFIT-TAKING

Seeing a 5x and eventually closing at a loss.

06 EXTREME SLIPPAGE

Accepting much worse execution without control.

08 FOLLOWING INFLUENCERS

Confusing promotion with independent analysis.

10 REVENGE TRADING

Risking more in an attempt to recover quickly.

07

TOMMYSBANK PLAYBOOK

COMPLETE GLOSSARY

The terms you will encounter every day in memecoin trading.

WWW.TOMMYSIGNALS.COM

Glossary A to M

Simple, practical definitions.

TERM	MEANING
Address / Public address	A public address used to receive assets. It is not the seed phrase.
Airdrop	Distribution of tokens to wallets or users. It may be legitimate or used as phishing bait.
All time high, ATH	The highest price or market cap ever reached.
AMM	Automated Market Maker. A mechanism that uses liquidity pools to execute swaps.
Alpha	Information or an advantage considered useful before it becomes known to the market. It does not guarantee profit.
Balance	Available balance. In this guide, it means the operating capital allocated to trading.
Blockchain	A distributed ledger on which transactions and ownership are recorded.
Bonding curve	A formula that changes the token price as buying activity rises or falls.
Bundled supply	Supply distributed or purchased in a coordinated way by connected wallets.
CA, Contract Address	The token's unique identifier. On Solana, it is often called the mint address.
CEX	A centralized exchange that holds accounts and orders.
Circulating supply	The amount of tokens considered to be in circulation.
Cold wallet	A wallet or device kept offline to reduce exposure.
DCA	Purchases spread over time. With very risky memecoins, this must not become automatic averaging down.
DEX	A decentralized exchange that enables onchain swaps through wallets and smart contracts.
Diamond hands	Slang for someone who holds a position despite volatility. It is not always a virtue.

Glossary H to M

Second part of the terms from A to M.

TERM	MEANING
DYOR	Do Your Own Research. Verify the information yourself before buying.
Entry	The average entry price or market cap.
Exit	A partial or complete sale of the position.
FDV	Fully Diluted Valuation. Price multiplied by the maximum or total supply.
Fee	A cost charged by the platform, swap, or network.
FOMO	Fear of missing an opportunity, a common cause of late entries.
FUD	Fear, Uncertainty and Doubt. Fear and uncertainty, whether real or manipulated.
Gas	The network cost required to execute an onchain transaction.
Holder	A wallet that holds the token. It does not always represent a distinct person.
Honeypot	A token that can be purchased but not sold, or that has major selling restrictions.
Insider	A person with early access or privileged information about the project.
Launchpad	A platform that simplifies token creation and launch.
Liquidity	The ability to buy and sell without moving the price too much.
Liquidity pool	A pair of assets locked in a smart contract to enable swaps.
Market cap	Price multiplied by circulating supply. It measures the estimated total valuation.

Glossary M to Z

Second part of the practical vocabulary.

TERM	MEANING
MEV	Value extracted from transaction ordering. It can worsen execution in onchain environments.
Mint authority	Permission to create new tokens and increase the supply, if it remains active.
Moonbag	The remaining portion held after taking profits.
NFA	Not Financial Advice. A phrase reminding readers that the content is not financial advice.
Onchain	Data or activity recorded directly on the blockchain.
PNL	Profit and Loss. The profit or loss on a position.
Price impact	The effect of your trade on the pool price.
Private key	A secret key that controls the wallet. It must never be shared.
Pump	A rapid price increase. It may be organic or manipulated.
Pump and dump	An artificially promoted increase followed by insider selling.
Realized PNL	Profit or loss already realized through a sale.
Renounced authority	An authority permanently revoked. It reduces one specific risk, not every risk.
Resistance	An area where selling blocked previous increases.
Risk reward	The relationship between potential loss and expected profit.
Rug pull	Value extraction or abandonment that causes the token to collapse.
Seed phrase	A secret sequence that allows the wallet to be recovered and controlled.

Glossary S to Z

Final part of the practical vocabulary.

TERM	MEANING
Sell pressure	Pressure generated by a high flow of sales.
Slippage	The difference between the expected price and the actual execution price.
Smart contract	Onchain code that defines the rules and functions of a token or protocol.
Sniper	A trader or bot that buys during the earliest phase of a launch.
Stop loss	A planned exit when the trade is invalidated. With memecoins, it may experience slippage.
Support	An area where buyers appeared in the past.
Supply	The existing or planned number of tokens.
Take profit, TP	A planned sale to realize profit.
Ticker	The token abbreviation, such as DOGE. It is not a unique identifier.
Tokenomics	The structure of the token's supply, distribution, incentives, unlocks, and utility.
Top holder	Wallets holding the largest amounts of the token.
Unrealized PNL	Profit or loss not yet realized because the position remains open.
Volume	Value traded during a period. It may be real or manipulated.
Whale	A holder with a position large enough to influence the market.
2x, 5x, 10x	A multiple of the entry price or value. 2x means a gross doubling.

Frequently asked questions

Quick answers to the most common questions.

Can I start with a small amount?

Yes, but fees, slippage, and minimum position sizes may have a major impact. Use the initial amount mainly to learn the process, not to chase unrealistic gains.

Do I have to buy every signal?

No. Skipping a trade with weak data or an already extended price is part of risk management.

Why did the value fall immediately after I bought?

You may have experienced price impact, slippage, sales by other holders, or entered after an already extended move.

Why am I unable to sell?

Possible causes include insufficient liquidity, a network error, slippage set too low, token restrictions, or a honeypot. Do not grant additional permissions or sign random links to “unlock” the sale.

Do I always have to wait for 2x?

No. The target is a framework. If the trade is invalidated, alerts appear, or momentum dies, you may exit earlier.

What does recovering the initial investment mean?

Selling a sufficient portion to receive the amount originally invested. In the basic method, selling half of the tokens at 2x recovers approximately the initial investment before costs.

Is it better to sell everything or leave a moonbag?

It depends on risk and the data. A moonbag allows participation in further upside, but it can also go to zero. It is not mandatory.

How long should I hold a memecoin?

There is no standard holding period. It may be minutes, hours, or days. Follow the plan and the data, not emotional attachment.

Trading cheat sheet

A page to review before every trade.

BEFORE AND DURING THE PURCHASE

1. Open the TOMMYSBANK notification.
2. Copy the contract address.
3. Paste it into Fomo search.
4. Compare the CA, chain, and token.
5. Check market cap and liquidity.
6. Check holders, authorities, and alerts.
7. Calculate size from the operating balance.
8. Review fees, slippage, and price impact.
9. Buy and record the entry and plan.

MANAGEMENT AND EXIT

- At 2x: sell 50% of the initial tokens.
- At 5x: sell another 25% of the initial tokens.
- Moonbag: manage the remaining 25%.
- Red flag: exit or skip the trade.
- Never: all in, loans, seed phrase.
- Never: buy only because of FOMO.
- Never: increase size for revenge.
- Always: take profits with discipline.
- Always: record the trade in your journal.

FINAL QUESTION BEFORE BUYING

"If this position goes to zero, will my balance and my judgment remain intact?" If the answer is no, reduce the size or do not enter.

Note about Fomo promotions

The 10% fee discount and the opportunity to participate in giveaways worth up to \$300 in crypto are stated based on promotional information provided by TOMMYSBANK. Availability, requirements, eligible territories, duration, and prizes must be verified directly on the Fomo platform at the time of registration.

Final disclaimer

This guide is not financial, legal, or tax advice. It does not constitute a personalized invitation to buy or sell crypto assets. Past results, numerical examples, and cited multiples do not guarantee future results. Memecoins involve extreme volatility, technology risk, counterparty risk, liquidity risk, manipulation, fraud, and the total loss of capital. Consult qualified professionals for advice specific to your circumstances.
